

# Forward Problem of EEG

Zeynep AKALIN ACAR 14th EEGLAB Workshop, Mallorca September, 2011

# Forward and inverse problem

# **Components of source localization**

- Numerical head model
- Choice of numerical method
- Conductivity distribution in the head
- Co-registration of EEG electrodes with MRI
- Number/position of electrodes on the head surface
- A priori information of source space
- Processing of EEG signals
- Choice of inverse model

#### Generators of EEG

#### Baillet et al, 2001

# Equivalent cortical dipoles

## Potential fields on the scalp

## Potential fields on the scalp

#### Formulation of the FP

# To Solve the Forward Problem

- Head Model
  - Conductivity values
  - Geometry
- Source distribution
  - Magnitude
  - Location
  - Direction
- Field Locations
- Solver

# Head Modeling Comparison

#### **Simple Head Models**

- Single layer sphere, spheroid
- ✤ 3-4 layer sphere

#### ANALYTICAL SOLVER Simple, fast, but not accurate

#### **Realistic Head Models**

- Boundary Element
- Finite Element
- ♦ Finite Difference

NUMERICAL SOLVER Represents head shape better, but computationally complex

### **Numerical Head Models**

BEM

#### NFT BEM mesh

**FEM** 

Generated using Tetgen from NFT BEM mesh

# FEM/BEM comparison

|  | BEM     | FEM       |
|--|---------|-----------|
| Position of computational points       | surface | volume    |
| Free choice of<br>computational points | yes     | yes       |
| System matrix                          | full    | sparse    |
| Solvers                                | direct  | iterative |
| Number of compartments                 | small   | large     |
| Requires tesselation                   | yes     | yes       |
| Handles anisotropy                     | no      | yes       |

# Potentials on the scalp

# **Components of source localization**

- Numerical head model

| Patient 3         | 36  | 53.7     | 6.2      |
| Patient 4         | 46  | 34.4     | 9.7      |
| Patient 5         | 50  | 32.0     | 10.3kama |
| Post mortem skull | 68  | 21.4     | 15.7     |

# Anisotropy

- Directional conductivity for skull and WM.
- WM anisotropy can be obtained from diffusion tensor imaging (DTI).
- WM

anisotropy ratio = 9:1

Skull
 ratio = 10:1

# Anisotropy

Return currents for a left thalamic source on a coronal cut Wolters et al, 2006

# **Components of source localization**

- Numerical head model
- Choice of numerical method
- Conductivity distribution in the head
- Co-registration of EEG electrodes with MRI
- Number/position of electrodes on the head surface
- A priori information of source space
- Processing of EEG signals
- Choice of inverse model

Simulation study, spherical model, 1152 dipoles

# **Components of source localization**

- Numerical head model
- Choice of numerical method
- Conductivity distribution in the head
- Co-registration of EEG electrodes with MRI
- Number/position of electrodes on the head surface
- A priori information of source space
- Processing of EEG signals
- Choice of inverse model

#### Source models

# **Cortical patch sources**

#### **Distributed source models**

#### Source space: Cortical surface

#### **Overlapping patches**

### Inverse Problem

#### **Parametric Methods**

- Overdetermined
- Searches for parameters of a number of dipoles
- Nonlinear optimization techniques
- May converge to local minima
- Non-linear least squares, beamforming, MUSIC, simulated annealing, genetic algorithms, etc.

#### **Imaging Methods**

- Underdetermined
- Searches for activation in given locations.
- Linear optimization techniques
- Needs additional constraints
- Bayesian methods, MNE, LORETA, LAURA, etc.

Effects of Forward Model Errors on EEG Source Localization

#### **MODELING ERRORS**

# Head Model Generation

- Reference Head Model
  - From whole head T1 weighted MR of subject
  - 4-layer realistic BEM model
- MNI Head model
  - From the MNI head
  - 3-layer and 4-layer template BEM model
- Warped MNI Head Model
  - Warp MNI template to EEG sensors
- Spherical Head model
  - 4-layer concentric spheres
  - Fitted to EEG sensor locations

# The Reference Head Model

- 18541 nodes
- 37090 elements
  - 6928 Scalp
  - 6914 Skull
  - 11764 CSF
  - 11484 Brain

### The MNI Head Model

- ♦ 4-layer
  - 16856 nodes
  - 33696 elements
- ♦ 3-layer
  - 12730 nodes
  - 25448 elements

### The Warped MNI Head Model

#### Registered MNI template

Warped MNI mesh

## The Spherical Head Model

4-Layer model Outer layer is fitted to electrode positions

# Head Modeling Errors

- Solve FP with reference model
  - 3D grid inside the brain.
  - 3 Orthogonal dipoles at each point
  - ~7000 dipoles total
  - 4 subjects
- Localize using other head models
   Single dipole search.
- Plot location and orientation errors

# **Spherical Model Location Errors**

#### **3-Layer MNI Location Errors**

**3-Layer MNI** 

**3-Layer Warped MNI** 

#### **4-Layer MNI Location Errors**

4-Layer MNI

4-Layer Warped MNI

#### **Error Percentiles for Four Subjects**

### **Average Errors for Four Subjects**

## Observations

- Spherical Model
  - Location errors up to 3.5 cm. Cortical areas up to 1.5 cm.
- ♦ 3-Layer MNI
  - Large errors where models do not agree.
  - Higher around chin and the neck regions.
- ♦ 4-Layer MNI
  - Similar to 3-Layer MNI.
  - Smaller in magnitude.

### Electrode co-registration errors

- Solve FP with reference model
- Shift all electrodes and re-register
  - 5° backwards
  - 5° left
- Localize using shifted electrodes
- Plot location and orientation errors

### 5° Backwards Location Errors

### 5° Left Location Errors

#### **Observations**

- Errors increase close to the surface near electrode locations.
- Changing or incorrectly registering electrodes may cause 5-10 mm localization error.

# Effect of Skull Conductivity

- Solve FP with reference model
  - Brain-to-Skull ratio: 80
- Generate test model
  - Same geometry
  - Brain-to-Skull ratio: 20
- Localize using test model
- Plot location and orientation errors

#### FP ratio: 80 IP ratio: 20

# Conclusion

- Head shape
  - Most impact on source localization accuracy.
- Incorrect electrode registration
  - Errors near the electrodes
  - Most studies investigate cortical activity close to the electrodes.
- Electrical properties
  - Number of layers
  - Relative conductivities (Brain-to-Skull ratio)

### **Epilepsy surgery**

#### **Project Summary**

# **Epilepsy Head Modeling**

- Large hole in skull
- Plastic sheet
- A pre-surgery MR and post-surgery CT
- Differences in brain shape after surgery
- Co-registration of electrodes
  - Subdural from CT segmentation
  - Scalp no digitizer data

MR

# Scalp, skull and sheet models

Number of elements Scalp: 10000 Skull: 30000 Plastic sheet : 7000

Z. Akalin Acar - Head Modeling and Cortical Source Localization in Epilepsy

# Analyzing Epilepsy Recordings

CT image of the implanted grid electrodes

- Pre-Surgical Evaluation
- Rest Data
- Simultaneous recordings
  - 78 iEEG electrodes
  - 29 scalp electrodes
- Provided by Dr. Greg Worrell, Mayo Clinic

#### Data

- 16 minutes ECoG + EEG data
- ◆ 2 seizures (1.9 min + 1.5 min)
- ♦ ECoG = 78 channels, EEG = 29 channels

### iEEG data

#### Independent Component Analysis

Z. Akalin Acar - Head Modeling and Cortical Source Localization in Epilepsy

#### Independent Components

Potentials on scalp Potentials on plastic sheet

On the brain surface

IC 52

### **Source Localization Results**

#### **Dipole source localization**

IC 1

IC 52

Radial source

**Tangential source** 

**Distributed source localization - SBL** 

Gyral source

Sulcal source

#### Cortical activity of seizure components

# Activations of 13 seizure components

Cortical activity of Seizure components  $Movie(t) = \sum_{i=1}^{13} S_i \times Act_i(t)$ 

# Conclusion

- ICA can detect and identify seizure components in the EEG data.
- Correct source localization requires correct forward problem solution.

## **Distribution of electrodes**

Michel et al, 2004

### Head modeling in epilepsy

### **BEM Formulation**

Integral equation for Potential Field:

$$\phi(\vec{r}) = 2g(\vec{r}) + \frac{1}{2\pi} \sum_{k=1}^{n} \left( \frac{\sigma_{k}^{-} - \sigma_{k}^{+}}{\sigma_{i}^{-} + \sigma_{i}^{+}} \right) \int_{S_{k}} \phi(\vec{r}) \frac{\vec{R}}{R^{3}} \cdot d\vec{S}_{k}(\vec{r})$$

### **BEM Formulation**

Integrating the previous integral equation over all elements a set of equations are obtained.

In matrix notation for the potential field we obtain

$$\Phi_{M\times 1} = C_{M\times M} \Phi + g_{M\times 1} \qquad \Phi = [I - C]^{-1} g \qquad \Phi = \mathbf{A}^{-1} g$$

M: number of nodes

The expression for the magnetic field:

 $B_{n\times 1} = B_0 + \mathbf{H}_{n\times M} \Phi$ 

*n*: number of magnetic sensors

## Algebraic formulation of the FP

Scalp potentials for N electrodes and p dipoles:

$$V(r) = \sum_{i}^{p} g(r, r_{dip}, d_{i}) = \sum_{i}^{p} g(r, r_{dip}, e_{d_{i}}) d_{i}$$

$$V = \begin{bmatrix} V(r_{1}) \\ \vdots \\ V(r_{N}) \end{bmatrix} = \begin{bmatrix} g(r_{1}, r_{dip}, e_{d_{1}}) & \cdots & g(r_{1}, r_{dip}, e_{dp}) \\ \vdots & \ddots & \vdots \\ g(r_{N}, r_{dip}, e_{d_{1}}) & \cdots & g(r_{N}, r_{dip}, e_{dp}) \end{bmatrix} \begin{bmatrix} d_{1} \\ \vdots \\ d_{p} \end{bmatrix} = G(\{r_{j}, r_{dip_{i}}, e_{d_{i}}\}) \begin{bmatrix} d_{1} \\ \vdots \\ d_{p} \end{bmatrix}$$

For N electrodes and p dipoles and T discrete time samples:

$$V = \begin{bmatrix} V(r_1,1) & \cdots & V(r_1,T) \\ \vdots & \ddots & \vdots \\ V(r_N,1) & \cdots & V(r_N,T) \end{bmatrix} = G(\{r_j,r_{dip_i},e_{d_i}\}) \begin{bmatrix} d_{1,1} & \cdots & d_{1,T} \\ \vdots & \ddots & \vdots \\ d_{p,1} & \cdots & d_{p,T} \end{bmatrix}$$
$$V = GD + n$$

diameter:  $3mm \sim 10^5 - 10^6$  pyramidal cells A large pyramidal cell would have  $\sim 10^4 - 10^5$  synapses
